NTIA

UAS or drones have been around and in operational use by the U.S. Army after WWII. It is unfortunate it has taken this long, over 60 years, to get to this point.

The challenge now is to promote a growing industry that is finally taking off in a safe manner.

The American Society of Photogrammetry and Remote Sensing is a nonprofit professional industry representing business, government and academic sectors on the use and sensors for mapping from UAS, aircraft and spacecraft.

All aircraft systems require the maps and coordinate systems used to fly through airspace and land safely. With the potential addition of millions more UAS aircraft, it is imperative the proper use and application of remote sensing systems are used with ASPRS mapping standards to insure safe operations.
