The Public Computer Centers application of the Coral Gables Outreach project will enhance the City's existing datacenter and broadband service capacity to provide the additional computing and network power required for the education programs. The projected computer center enhancement will provision network electronics, virtualized server infrastructure, centralized storage, operating systems, database systems, network utilities, low voltage cabling services, and technical staff hours. Coral Gables Outreach is a plan to expand and enhance the current institutional network (I-net) serving public and private educational, cultural and research organizations. The I-net as originally planned would have connected up to forty (40) public and private locations within the City of Coral Gables. Local government has limited ability to provide citizens with access to broadband when not served by private interests. Public safety, research, health, education and other service organizations are greatly impacted by the cost of technology in providing and delivering on their core missions. The program improves quality of life of Seniors; provides access to telemedicine programs from hospitals and clinics, provides access to online resources for Seniors (Social Security, Medicaid, Medicare, government forms, AARP, etc.). It improves computer/digital literacy and skills for job training and career advancement; it provides online access to jobs and career resources and applications, and it enables economic development through reducing unemployment rates, stimulating the economy. It also improves quality of life for children and young adults through education; provides access to online resources for recreation, education, arts, culture and science. With this model and additional resources business consulting and training for success, efficiency, and sustainability (Six-Sigma, Lien Agile, Business Administration/management) can also be included in the program.
