V-Health will provide primary healthcare services for low-income consumers in rural and underserved areas of South Carolina through the use of broadband technology and advances in tele-health technology. The V-Health Clinics will provide diagnostic and therapeutic services that are routinely performed in a primary care outpatient setting by mid-level healthcare providers (Family Nurse Practitioners and Physician Assistants). The business plan proposes single hub/clinic where the medical doctor is located and five (5) satellite clinics staffed by Nurse Practitioners. Through the use of high definition video and telemetry equipment, the centrally located doctor(s) will be able to evaluate, diagnose and treat patients. This business plan will promote broadband deployment by funding an anchor institution for the use of broadband as well as proving that high quality primary care can be provided by Telemedicine. The target market is low-income patients in rural areas of South Carolina. Revenues will be derived from Medicare and Medicaid reimbursements for medical services provided to qualifying patients. Additionally, revenue will be received from patients with other third party payers and from cash paying patients. The uniqueness of this business model is the use of Telemedicine technology to minimize costs in providing primary care medical services to underserved and vulnerable individuals in rural and low-income areas of South Carolina. Rather than having to staff 5 separate clinics with medical doctors, we are able to lower the cost of service by utilizing Nurse Practitioners, with direct access to a medical doctor through high definition video service along with remote monitoring medical equipment. In addition to face-to-face encounters between patients and physicians via high definition video, images will be provided by digitally interfaced medical diagnostic instruments (e.g. otoscope, stethoscope, magnification enhanced camera, EKG, spirometry). Additionally, we will utilize Electronic Medical Records, which have been demonstrated to improve clinical outcomes, enhance operational efficiency, assure greater patient safety and contribute to cost-savings in primary care practice. Cost benefits include savings related to decreased medical errors, increased efficiency of medical records management, reduced medical transcription costs, enhanced insurance billing efficiency, reduced staff absenteeism, improved staff satisfaction, improved patient satisfaction. V-Health will have a total of 53 highly skilled employees upon full implementation of the business plan as detailed below. Based on financial projections below, the Company will be free cash flow positive after 3 years, with all profit returned to the Company for additional investments, including, but not limited to additional clinics, staffing and other health care services.
